

Managed Services for Zscaler

Deployed ≠ Defended

Most Zscaler estates we assess have meaningful policy gaps. Not because of failure or negligence. Because Zero Trust is not a state. It's a practice.

Secure What's Next.

The **gap** nobody talks about

- ✓ You deployed Zscaler.
- ✓ You passed the audit.
- ✓ The dashboard is green.
- ✓ Leadership is happy.

Then the environment kept changing. New apps. New users. New AI tools. Workloads moving between clouds. Policies written at rollout, never revisited. Months pass. The gap between what you think you have and what's actually running widens. No alerts. No failures. Just exposure.

We call it drift. We see it everywhere.

~50%

of Zscaler environments
LevelBlue assesses show
meaningful policy gaps.

<1%

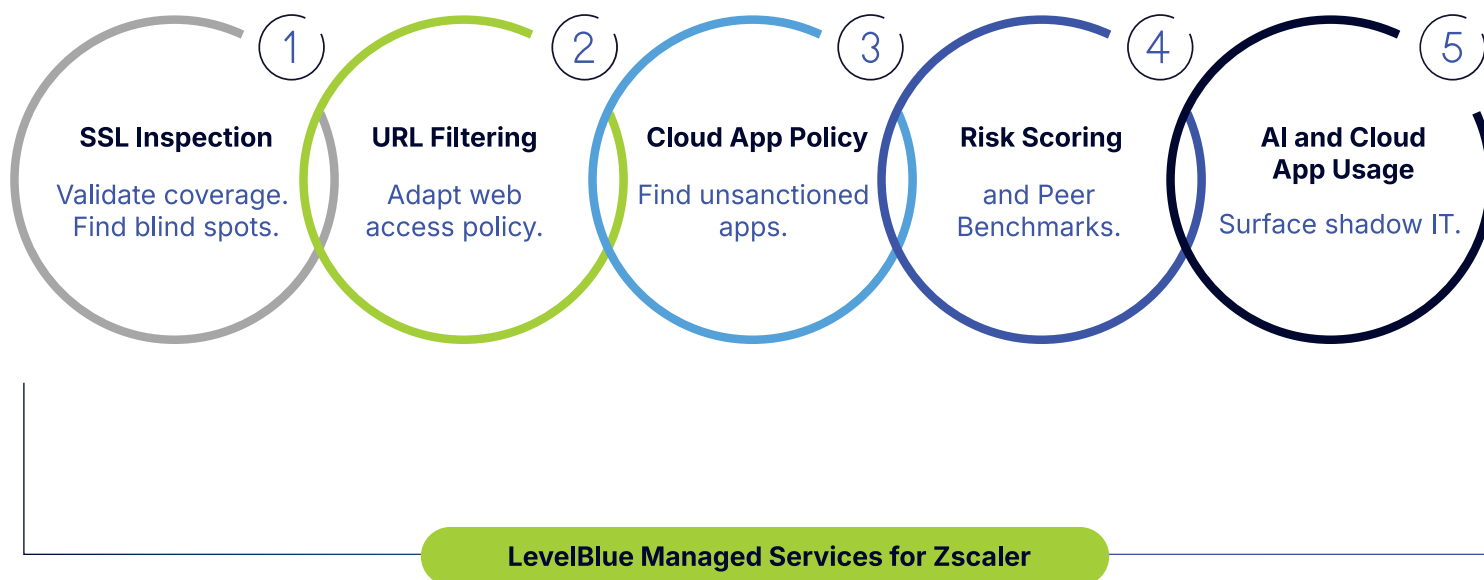

of qualified SSL traffic was being inspected
in one customer environment we assessed.
The dashboard was green. The posture
was not.

Stat reflects a single customer environment, not an aggregate metric

**The gap is not a technology gap. It's an attention gap. The foundation is already there.
What's missing is someone running the practice continuously.**

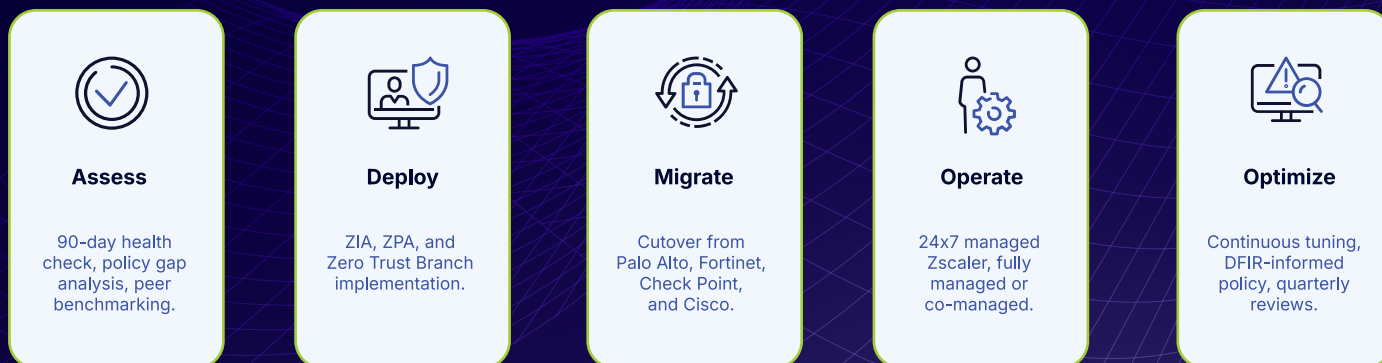

Five areas. Continuously validated.

LevelBlue's methodology for managed Zscaler is built around five areas of continuous validation.

Five services. Full lifecycle.

From first assessment to year five of operations, across the full Zscaler portfolio.

Zscaler, run for the long haul.
