

Network-Based Firewall

Advanced threat protection deployed on your virtual private network.

Staying ahead of advanced threats can be complex and costly. This is especially true for organizations with multiple branch office locations using security appliances, which require high upfront and ongoing expenses.

Modernize and simplify network security

In order to help reduce capital expense and improve scalability, companies should consider moving their network security controls, including firewalls, to a cloud-based model. Besides offering a more predictable monthly fee, deploying cloud-based firewalls are typically much faster than physical appliances since there is nothing to ship and no need to send a technician on-site. Obtaining this solution through a trusted managed security solutions provider can further simplify operations by outsourcing the day-to-day maintenance and support. LevelBlue Network-Based Firewall offers businesses the benefits of cloud-based perimeter security in line with an organization's virtual private network. It is provided as a 24x7 managed service with flexible change management options to accommodate each business' preference and availability.

Why LevelBlue for managed next-generation firewalls

LevelBlue Network-Based Firewall helps businesses by resolving the complexity associated with distributing and managing security controls within data centers. This solution uses best-of-breed technology to provide advanced threat protection and URL filtering for users and devices connected to the network. Centralized management gives administrators visibility of all firewalls deployed within their environment and allows them to deploy security policies across locations for consistent protection. Resiliency is paramount in security, so the firewall is deployed in a dual-rail configuration, mitigating single points of failure, to keep networks running.

Benefits

- **Consistent and centralized security:**
Apply security policies across data center and branch office locations with just a few clicks
- **Improved performance:**
Reduce latency with a firewall that is deployed inline with the organization's virtual private network
- **Flexible change management:**
Update security controls through the self-service portal or request support from LevelBlue
- **Superior reliability:**
Dualrail deployment virtually eliminates single points of failure to help keep businesses protected
- **Simplified troubleshooting:**
Our consolidated portfolio means that there is a single point of contact for all support
- **Reduced capital expense:**
Deploy new, faster security controls

This solution offers enhanced performance versus many other cloud-based firewalls that require the traffic to leave the network for enforcement. Offered as a 24x7 managed service, LevelBlue Network-Based Firewall includes initial deployment and around the clock monitoring by the LevelBlue Security Network Operations Center. Changes to security policy may be completed through the self-service portal or submitted to LevelBlue for implementation. Consolidating network connectivity and security can simplify both procurement and troubleshooting, and with a global network of network operations centers and security operations centers, more than 2,500 cyber-defense consultants, organizations can know that their network is in good hands with LevelBlue.

How it works
